ABOUT ME

Four-color printing also known as full color or 4 color printing is a process of creating colors using the CMYK (cyan, magenta, yellow and black) colors. Instead of physically mixing the colors, four colors mix a spectrum of colors using CMYK in order to create the colors desired. Two-color printing is a color printing process which uses two colors only. This is especially applicable in printing 2-colored logos and postcards. This process is one of the cheapest among the printing processes available these days. Pantone or PMS (Pantone Matching System) is a color system of mixed inks.

Industrial paints need specific colors to complement fixtures and designs. Usually, industrial paints are matched using the Pantone Matching System. To do this, choose a PMS color first then your choice of paint. That way it will be easy to pick paint colors.
Desktop Printers. Use the four-color printing system to reflect an accurate color for your documents, pictures and graphics.

GAME DESIGNER
Four-color printing also known as full color or 4 color printing is a process of creating colors process which uses two colors only.

GAME DEVELOPER
Four-color printing also known as full color or 4 color printing is a process of creating colors process which uses two colors only.

FULLSTACK DEVELOPER
Four-color printing also known as full color or 4 color printing is a process of creating colors process which uses two colors only.

PROBLEM SOLVER

Marketers/advertisers usually focus their efforts on the people responsible for making the purchase. In many cases, this is an effective approach but in other cases it can make for a totally useless marketing campaign. Virgin Mobile took a more effective approach in marketing their cell phone service by focusing not on the people that would be making the actual purchase.
